It was a good week for space science as a team of researchers affiliated with several institutions in the U.S., one in Canada and one in Israel discovered <u>the most massive white dwarf ever observed</u>—it was also the smallest, at just the size of the moon. Also, a team of astronomers

studying data from the WIYN 3.5-meter Telescope and the Gemini Observatory reported that <u>there could be many more Earth-sized planets</u> <u>than has been previously thought</u>—perhaps twice as many. And a team with members affiliated with several institutions in the U.S. <u>observationally confirmed Stephen Hawking's black hole theorem</u> for the first time.

In technology news, a team at the University of California, Berkeley, created <u>insect-sized robots that were able to navigate mazes with the</u> agility of a cheetah. Also, a combined team from the University of Maryland, College Park and the Baidu Research Robotics and Auto-Driving Lab, developed <u>an autonomous excavator for real-world</u> deployment—the system was able to conduct digging and loading tasks for long periods of time with no human intervention at speeds equivalent to human operators. And a team at the University of Waterloo announced that they had <u>developed a computer system able to generate</u> lyrics for live instrumental music—called LyricJam, the system was designed to help artists more easily compose songs. Also, a team at Rice University developed <u>a new method for indexing DNA databases much faster</u>. The group claims their method cuts indexing <u>time</u> from weeks to hours and also reduces search times to mere minutes.

In other news, a team with members affiliated with multiple institutions in the U.S. <u>found a potential path to a broadly protective COVID-19</u> <u>vaccine based on T cells</u>—possibly leading the way to vaccines that could protect against future variants. Also, the United Nations announced that <u>a new record high temperature had been recorded on the</u> <u>Antarctic continent</u>—18.3 degrees Celsius—yet another sign of a warming planet.

And finally, if you suffer from <u>high blood pressure</u>, you may want to check out a research effort conducted by a team at Colorado University, Boulder—they found that <u>exercising just five minutes a day</u>, in a certain

way, could lower blood pressure as well as prescribed medications.
